Site_2: Smal; A mini-library was made by cloning products derived from ORESTES PCR (U.S. Letters Patent application No. 196,716 - Ludwig Institute for Cancer Research) profiles into the pUC 18 vector. Reverse transcription of tissue mRNA and cDNA amplification were performed under low stringency conditions."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          0;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö

                                                                                                            ŏ
                                                                                                                                                                                                              ö
                A DNA molecule (AAT3358) codes for a protein (AAW02303) that confers on Mycobacterium tuberculosis an ability to survive within macrophages. It is a fragment of a larger molecule (AAT33556) obtd. by ligating M. tuberculosis genomic DNA fragments into paluescript II vector and screening recombinant E. colistrains for HeLa cellinvasive clones. It can be incorporated into a vector and used for prodn. Of recombinant macrophage survival protein, which is useful ir vaccines or for facilitating uptake of other materials, e.g. therapeutic genes, into mammalian cells. A second DNA molecule (tuberculosis the ability to enter mammalian cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Mycobacterium tuberculosis DNA - confers ability to enhance uptake of therapeutic agents e.g. antibiotics, also useful in vaccines
                                                                                                                                                                                                              Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The protein can be used in a vaccine to prevent M. tuberculosis infection, and provide for the uptake in cells of, e.g. antibiotics, DNA fragments or anti-neoplastic agents. Antibodies raised against it can be used to treat mammals already exposed to
                                                                                                                                                                                                              ;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The isolated DNA molecule of the invention confers on M. tuberculosis an ability to enter cells and to survive within macrophages. It encodes a polypeptide having a mol. wt. of about 50-55 kDa, pref. 52 kDa. The AA sequence represents a highly hydrophilic protein with a hydrophobic region at its carboxy terminus. It could be a secreted protein, a cytophasmic protein, or a surface protein with its carboxy terminus attached to the outer membrane of the organism. The deduced AA sequence is in AAR71931.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                DNA encoding for cellular uptake of Mycobacterium tuberculosis used to develop prods for vaccines, passive immunisation and diagnosis and cellular uptake of other materials

Mycobacterium tuberculosis DNA \cdot confers ability to enhance uptake of therapeutic ayents e.g. antibiotics, also useful in vaccines
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present sequence encodes a Mycobacterium tuberculosis cellular uptake protein frayment, which confers on M. tuberculosis an ability to enter meammalian cells and to survive within macrophages. The protein can be used in a varcine to prevent M. tuberculosis infection, and provide for the uptake in cells of, e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               antibiotics, DNA fragments or anti-neoplastic agents. Antibodies raised against it can be used to treat mammals already exposed to M. tuberculosis, to induce a passive immunity and prevent disease
                                                                                                                  DNA for M. tuberculosis cellular uptake protein fragment.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Sequence 1535 BP; 297 A; 544 C; 458 G; 236 T; 0 Other;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          A DNA molecule (AAT33656) confers on Mycobacterium tuberculosis an ability to enter mammalian cells and to survive within macrophages. The encoded protein sequence is given in AAW03301. The DNA was obid. by ligating W. tuberculosis genomic DNA fragments into pBluescript II vector and screening recombinant E. coli strains for HeLa cellinvasive clones. The DNA includes 2 separate coding regions (see also AR733657-58) coding for the cell entry (AAW03302) proteins. It can be used to produce the cellular uptake proteins used as vaccines or to facilitate uptake of other materials, e.g. therapeutic genes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          DNA giving M. tuberculosis ability to enter mammalian cells and/or survive within macrophage(s), useful in vaccines to protect mammals against Mycobacterium tuberculosis infection
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö

                                                                                                                                                                                                                                                                                                                                        This DNA sequence comprises Mycobacterium bovis BCG deletion sequence BCGdelta3. A specific genetic deletion of this region casults in an avirulence phenotype of the mycobacterium. 2 Other deletion regions (see AAT33535 and AAT33536) have also been detected. Identification involved Screening a BCG cosmid library with a radiolabeted probe obtained following DNA subtraction between virulent Mycobacterium tuberculosis H37Rv and avirulent BCG. The deletions provide useful markers for the identification of an avirulent, or a virulent, mycobacterial phenotype. Determination of a virulent, or a virulent, mycobacterial phenotype. Determination of a virulence requires the detection of the presence or absence of presence or absence of absence of absence of absence of absence of absence or absence or absence or absence or absence of the sequences contained within the deletion. Deletion polypeptides are used as components of immunological assays and in vaccines.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Neisseria meningitidis; Neisseria gonorrheae; antigen; vaccine; antigenic; diagnosis; immunogenic; infection; meningitis; septicaemia; antibacterial; gene therapy; ds.

represent novel Neisseria meningitis and N. gonorrheae polynucleotides and polypeptides. AAZ54577 to AAZ54576 and AAZ55473 represent polypeptides. AAZ54577 to AAZ54576 and AAZ55673 represent polypeptides. AAZ54577 to AAZ54576 and AAZ55673 represent promisers used in the exemplification of the present invention. The polypeptides, the polynucleotides, antibodies and compositions of the invention can be used as vaccines, as diagnostic reagents, and as immunogenic compositions. The polypeptides can be used in the manufacture of medicaments for treating or preventing infection du: to Neisserial bacteria (e.g. meningitis and septicaemia), to detect the presence of Neisseria bacteria, or or raise antibodies. They may also be used to screen for agonists or antiagonists, which may themselves have use as antibacterial agents. The polynucleotides of the invention may also be used in gene therapy protocols.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Masignani V, Mora M;

represent novel Neisseria meningitis and N. gonorrheae polynucleoides and polypeptides. AAX54537 to AAX54576 and AA254616 to AAX55473 represent Per Per Primers used in the exemplification of the present invention. The polypeptides, the polynucleoides, antibodies and compositions of the Invention can be used as vaccines, as diagnostic reagents, and as immunogenic compositions. The polypeptides can be used in the nanificature of medicaments for treating or preventing infection due to be used to Neisserial bacteria, or to raise antibodies. They may also be used to screen for agonists or antigonists, which may themselves have use as antibocterial agents. The polynucleotides of the invention may also be used in gene therapy protocols.
                                                                                                                                                                                                                                                                                  AA253015 to AA254546, AA254577 to AA254615, and AAY74253 to AAY75941
                                                                                                                                                                                               Novel Neisserial polypeptides predicted to be useful antigens for

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                 Nucleotide sequences AA211972-212358 represent open reading frames (ORFs) of Neisseria meningitidis and N. gonorrhoeae which encode antigenic proteins (see AAY38499-Y38944). The antigenic proteins, their fragments, their nucleic acids and antibodies are used for diagnosis, prevention (as vaccines) or treatment of Neisseria infections, such as meningitis, septicaemia and gonorrhea. Both organisms are closely related. Fragments of the nucleic acids are useful as hybridisation probes and antisense reagents.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Neisseria meningitidis; Neisseria gonorrheae; antigen; vaccine; antigenic; diagnosis; immunogenic; infection; meningitis; septicaemia; antibacterial; gene therapy; ds.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     0
                                                                                                                                                                                                                                                                                                The lgt locus (AAT14061) of Neiserria gonorrhoeae F62 contains 5 open reading frames, 1gth, 1gtb, 1gtC, 1gtD and 1gtE, coding for 5 glycosyltransferases (see also AAR9131-15) involved in gonococcal lipooligosaccharide (LOS) biosynthesis. The sequence was constructed from 2 clones isolated from an F62 gene bank in lambda-200 following screening with plasmid pR10p1. 3 of the coding sequences contain poly-G tracts that make them susceptible to premature termination. The lgt coding sequences can be used for prodn. of recombinant LGT glycosyltransferases that are utilised in biosynthesis of LOS useful in vaccine prepn.
                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                poly:glycosyl:transferase - isolated from N. gonorrhoeae, catalyses the addition of both Glenac and Galnac di:saccharide(s) units to a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      A lippoligosaccharide-encoding gene region (AAT49230) of Neisseria gonorrhoeae ATCC 33084 includes a coding sequence for a novel Neptylytocsyltransferase (PGTase) (AAM06576) that catalyses the addition of both Girnka and GalnAc disaccharides to a single galactose molecy. The products (AAW06577-80) of the other coding sequences of this region are not identified. The PGTase gene can be obtd. using standard techniques and incorporated into a vector to allow produ. of the PGTase in transformed host cells. The enzyme is useful in the synthesis of oligosaccharides.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              :

```

```
The sequence is that of a DNA fragment encoding a non-A non-B (NANB) hepatitis-specific antigen polypeptide, it can be used to produce the polypeptide recombinantly. It is derived from the DNA clone C10-E15. It can be used to dive PCR primers which are capable of detecting NANB hepatitis with high accuracy. See also AAQ20617-Q20629 and

                                                                                                                                                                                                                                                                                                                                                metazoan invertebrate organisms, such as insects and worms, or cultured carls, resulting in p53 expression or mis-expression. The cultured carls, resulting in p53 expression or mis-expression. The cultured carls, referably a planmaceutical agent or a pesticide, that or molecules, preferably a pharmaceutical agent or a pesticide, that modulates p53 activity. The genetically modified organisms or cells are also useful for studying p53 activity by detecting the phenotype caused by the expression or mis-expression of the p53 protein in the insect. The method additionally comprises observing a second insect having the expression or mis-expression of the p53 protein, where the causes the expression or mis-expression of the p53 protein, where the second animal additionally comprises a mutation in a desired gene and differences between the-pfenotype of the first and second identifies the desired gene as capable of modifying the function of the gene central for identifying other genes modulating the cells are also useful for identifying other genes modulating the function of, or interaction with the p53 gene.
                                                                                                                                                                                                                                         Novel p53 tumor suppressor gene encoding a protein useful for genetically modifying metazoan invertebrate organisms, such as insects for screening compounds of pharmaceutical use or a pesticide

The present sequence encodes the Streptococcus pneumoniae filty-four homologue (ffh) protein, which is a component of the protein secretory apparatus in bacteria, and the bacterial homologue of the eukaryotic Signal Recognition Particle. Fith proteins and polynucleotides are useful for diagnosing diseases related to over or underexpression of Ffh protein by identifying mutations in the Ffh gene, or determining Ffh protein or mRNN expression levels due to an infection of an organism with the Ffh gene. They can diagnose the stage and type of infection. Ffh proteins are also useful for screening for compounds which affect activity of the protein or surface or inhibition of the protein function. These can be used in treatment to inhibit (antagonist i.e. antibacterial drugs) or enhance (agonist) Ffh activity, in addition to direct administration of Ffh
                                    The sequence is that of a DNA fragment encoding a non-A non-B (NANB) hepatitis-specific antigen polypeptide, it can be used to produce the polypeptide recombinantly. It is derived from the DNA clone C10-E12. It can be used to give PCR primers which are capable of detecting NANB hepatitis with high accuracy. See also AAQ20617-Q20629 and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New Streptococcus pneumoniae Fifty-Four Homologue (Ffh) polypeptide and polynucleotide - useful as diagnostic reagents and for prevention and treatment of Streptococci infections, which cause otitis media, sinusitis and conjunctivitis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Streptococcus pneumoniae; "ffh, fifty-four homologue; antibacterial; infection; otitis media; conjunctivitis; bacteraemia; sinusitis; pleural empyema; endocarditis; meningitis; ds.

direct administration of antisense sequences to prevent expression. Ffh proteins (administration of antisense sequences to prevent expression. Ffh proteins (administered directly, in a vector and as a vaccine) and antibodies induce an immune response to immunise and prevent disease. Diseases diagnosed, prevented or treated include: bacterial infections, especially Streptococcus pneumoniae infections, which cause otitis media, conjunctivitis, bacteraemia, sinustits, pleural empyema, endocarditis and especially menigitis. Fft proteins, polynucleotides and their (ant)agonists can prevent adhesion of bacteria to matrix proteins, and are useful for use on wounds and body implants to prevent bacterial
                                                                                                                                                                                                                                                                                                                                  infection.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequence 1, Assequence 18, Sequence 18

PolyA mkNA was purified from each sample, pooled and cDNA synthesisked. The cDNA was directionally cloned into lambda Zap II (SIratagene) in the ECORI (5') and XhORI (3') SILUS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        963101A02.x1 C. reinhardtii CC-1690, Stress condition J. normalized Lambda Zap H. Chlamydomonas reinhardtii CDNA, mRNA sequence.
